# Appendix 8.2 Collision Risk Modelling Report: September 2020 – August 2022

# Introduction

#### Overview

ITPEnergised was appointed by the Applicant to undertake collision risk modelling using data taken from their ornithological surveys (as commissioned by the Applicant) in support of a proposed wind farm development at Nisthill in Orkney. In order to assess the likely impacts of the Proposed Development on the local bird population, analysis for the potential for collision risk has been undertaken on certain key species. The analysis has been undertaken using the design freeze layout and development boundary, as displayed in **Appendix 8.1: Figure 1**, and a provisional turbine specification as outlined in Table 1.

Table 1 Candidate Turbine - Siemens Gamesa SG-155

| Parameter                   | Value                              |
|-----------------------------|------------------------------------|
| Viewshed Area (Within site) | 120.33 Ha (VP1 – 95.4: VP2 – 79.6) |
| Overlap                     | 54.9 Ha                            |
| No. turbines                | 4                                  |
| Rotor Diameter              | 155 m                              |
| Hub Height                  | 102.5 m                            |
| Max rotor depth             | 4.2 m                              |
| Max chord                   | 4.5 m                              |
| Pitch                       | 6°                                 |
| Rotation period             | 5.17 secs                          |
| Turbine 'lifetime'          | 25 years                           |

# Collision Risk Modelling

Band *et al.* (2007) described a method by which field data on bird flight activity can be gathered and used to quantify crudely the likelihood of collisions with turbines: the 'Band' Collision Risk Model (CRM). This method is more suitable for some species than others (Madders & Whitfield 2006). For example, fast moving raptors like merlin and most songbirds are difficult to detect beyond a distance of a few hundred metres and nocturnal species are difficult to detect at all. As a result, it is rarely possible to generate reliable estimates of flight activity for these species and collision risk is best determined qualitatively.

The Band CRM involves two methods to predict estimated collision fatalities, depending on the pattern of flight of the species involved: 'predictable' and 'unpredictable' flight methods. The predictable flight method (PFM) is appropriate when birds tend to move through an area in a relatively consistent direction, such as during migration or when moving between localised feeding and roosting sites. The unpredictable flight method (UFM) is more appropriate when flights are not in any particular direction and assumes that they are random.

#### **Data Collection and Species Selection**

Surveys were undertaken from two VPs between September 2020 and August 2022 with 151 hours at VP1 and 144 hours at VP2, this time period constitutes two breeding seasons and two non-breeding seasons.

A total of 9 target species were recorded from the VP surveys and are summarised below in Table 2. All the survey flights were recorded onto ArcGIS and the data entered into an excel spreadsheet and further analysed in order to select all the flights which were recorded at potential collision height ('PCH') within the viewshed of the VP. PCH is the height between the low and high points of the rotor sweep of the turbine blades, namely between 25 and 180m, all flights and the total number of individuals recorded at PCH within the site boundary from each viewshed of the VP are displayed below in Table 2.

Records at specific height bands were only recorded within the site boundary meaning the Collision risk Zone (CRZ) is a volume which covers the site at PCH. A total of five species (merlin and white-fronted goose with no at-risk seconds, hen harrier with just 32 at-risk seconds across two full years of survey, Arctic skua with 180 at-risk seconds and a 99.5% avoidance rate and whooper swan with a single flight and a 99.5% avoidance rate) are not considered to be significantly affected by collision with the proposed turbines and are not taken forward for collision risk modelling (Table 2).

Of the four remaining species, three were considered to use the site in a random way (great skua, peregrine and short-eared owl) and one was considered to use the site in a predictable way and as such was assessed using the linear model (red-throated diver).

Table 2 Target Species Recorded September 2020 – August 2022

| Species                 | Flights | Total no<br>birds in<br>flights | Duration | In site | In site<br>@ PCH<br>(25-<br>180m) | Total No. Of At<br>Risk Flight Sec.<br>(No. seconds at<br>PCH 25-<br>180m*no birds<br>in flights) | Collison<br>Risk<br>Modelling<br>carried<br>Out |
|-------------------------|---------|---------------------------------|----------|---------|-----------------------------------|---|---|

| White-<br>fronted goose | 1       | 13                              | 323      | 0       | 0                                 | 0   | NO  |
| Whooper<br>swan         | 1       | 3                               | 112      | 52      | 52                                | 156   | NO  |

## Methods

Collision risk has been calculated based as an average figure for the area covered by the site (Appendix 8.1: Figure 1) and based on a layout of four wind turbines of the specifications outlined in Table 1. It should be noted that the resultant figures provide an average for the site as a whole and does not allow for the potential of configuring a layout in order to minimise the impacts of the proposed turbines.

The predicted level of collision mortality is based on results obtained from a collision risk model which uses flight activity data, species' parameters and turbine specifications to obtain a collision rate as outlined in SNH guidance (SNH, 2000). The collision risk modelling follows two models, firstly

the random flight model which is used for foraging or displaying birds and secondly the regular model used for commuting or migrating birds.

The guidance also outlines bird biometrics including bird length and wingspan as well as flight speeds and recommended avoidance rates which are inputs into the model and the figures for the species carried forward for collision risk in this assessment are outlined in Table 3 below.

Data on bird flight speed and biometrics were taken from Alerstam *et al.* (2007) and the published avoidance rates was used (SNH 2017).

Detailed data on survey dates, times and weather can be found in **Appendix 8.1: Annex A: Table A1.** For reference, all great skua flights at PCH are presented in Figure 1 and red-throated diver in Figure 2.

**Table 3 Target Species Bird Biometrics** 

| Species Name          | Bird length (m) | Wingspan (m) | Flight speed (m/s) | Avoidance Rate (%) |
|-----------------------|-----------------|--------------|--------------------|--------------------|
| Great skua            | 0.56            | 1.36         | 14.9               | 99.5               |
| Peregrine             | 0.42            | 1.02         | 16.0               | 98                 |
| Short-eared owl       | 0.38            | 1.02         | 8.0                | 98                 |
| Red-throated<br>diver | 0.61            | 1.11         | 17.0               | 99.5               |

#### Results

Four species were taken forward for collision risk modelling, three using the random model (great skua, peregrine and short-eared owl) and the other using the linear model (red-throated diver).

Full working examples for Year 1 for each are outlined below and a summary of the results for Year 2 is also outlined (the only difference being a survey period of April – September in Year 1 as compared to a survey period of April to August in Year 2). A summary of all the results for clarity is shown in Table 4 below.

## **Table 4 Collision Risk Modelling Results**

| Species Name                                      | Year 1<br>Collision<br>Rate | Year 2<br>Collision<br>Rate | Average<br>Collison<br>rate | Collisions - Scheme<br>Lifetime (using<br>notional 25 years<br>for comparison) | Years per<br>collision |
|---|-----------------------------|-----------------------------|-----------------------------|--|------------------------|
| Great skua<br>(breeding -<br>season only)         | 0.077                       | 0.033                       | 0.055                       | 1.385  | 18.047                 |
| Peregrine<br>(annual)                             | 0.018                       | 0.001                       | 0.009                       | 0.233  | 107.071                |
| Red-throated<br>diver (breeding -<br>season only) | 0.075                       | 0.024                       | 0.050                       | 1.238  | 20.202                 |
| Short-eared owl                                   | 0.032                       | 0.007                       | 0.019                       | 0.485  | 51.493                 |

## **CRM Calculations**

Stage 1: Number of Birds Flying Through the Rotors per Year

Calculate the number of hours of observation expressed in hectare hours.

Hectare hours = viewshed@PCH (in site) \* survey duration (hrs)

vp1 =95.4Ha

vp2 =79.6Ha

Overlap = 54.9 Ha

Table 5 – Hectare Hours Calculation – April to September 2021 for Great Skua and red-throated diver only

| Date      | VP | Start Time | End Time | Hours | Ha hours |
|-----------|----|------------|----------|-------|----------|
| 07-Apr-21 | 1  | 14:00      | 17:00    | 3     | 286.2    |
| 10-Apr-21 | 2  | 07:00      | 10:00    | 3     | 238.8    |
| 19-Apr-21 | 1  | 04:30      | 07:30    | 3     | 286.2    |
| 19-Apr-21 | 2  | 13:00      | 16:00    | 3     | 238.8    |
| 04-May-21 | 2  | 15:00      | 18:00    | 3     | 238.8    |
| 04-May-21 | 1  | 19:00      | 22:00    | 3     | 286.2    |
| 25-May-21 | 2  | 06:00      | 09:00    | 3     | 238.8    |
| 25-May-21 | 1  | 13:00      | 16:00    | 3     | 286.2    |
| 07-Jun-21 | 1  | 03:30      | 06:30    | 3     | 286.2    |
| 08-Jun-21 | 2  | 19:00      | 22:00    | 3     | 238.8    |
| 15-Jun-21 | 2  | 07:00      | 10:00    | 3     | 238.8    |
| 15-Jun-21 | 1  | 11:00      | 14:00    | 3     | 286.2    |
| 12-Jul-21 | 2  | 09:00      | 12:00    | 3     | 238.8    |
| 12-Jul-21 | 1  | 14:00      | 17:00    | 3     | 286.2    |
| 20-Jul-21 | 2  | 07:00      | 10:00    | 3     | 238.8    |
| 20-Jul-21 | 1  | 18:00      | 21:00    | 3     | 286.2    |
| 03-Aug-21 | 1  | 05:00      | 08:00    | 3     | 286.2    |
| 03-Aug-21 | 2  | 12:00      | 15:00    | 3     | 238.8    |
| 24-Aug-21 | 2  | 06:00      | 09:00    | 3     | 238.8    |
| 24-Aug-21 | 1  | 15:00      | 18:00    | 3     | 286.2    |
| 14-Sep-21 | 2  | 08:00      | 11:00    | 3     | 238.8    |
| 14-Sep-21 | 1  | 13:00      | 16:00    | 3     | 286.2    |
| 28-Sep-21 | 1  | 07:00      | 10:00    | 3     | 286.2    |
| 28-Sep-21 | 2  | 16:00      | 19:00    | 3     | 238.8    |
| Total     |    |            |          |       | 6300     |

Calculate hectare seconds = hectare hours \* 3600

= 6300 \* 3600

= 22,680,000

#### Great skua – Year 1

Great skua were recorded in September 2020 but as this period was not part of a full continuous breeding season, calculations are based on the full 2021 breeding season recordings i.e. between April and September 2021 when great skua, which spend the winter out on the open ocean, are present in the UK.

A total of 24 great skua flights were recorded between April and September 2021 including a combined total of 26 great skua. Of the 24 flights, 18 were recorded 'at-risk', i.e at collision height over the site, and therefore are included in the collision risk modelling (See Figure 1).

<u>Calculate the bird observation in all areas and percentage of time birds active in overall observed</u> <u>area.</u>

Table 5 All Great Skua flights April – September 2021

| Hours per day - 25% of night        | 2.375  | 1.775   | 1.425  | 1.575   | 2.125   | 2.8   |
| Total flight hours per day 5%       | 14.975 | 17.255  | 18.585 | 18.015  | 15.925  | 13.36 |
| Total flight hours per day 25%      | 16.875 | 18.675  | 19.725 | 19.275  | 17.625  | 15.6  |
| Total days per month                | 30     | 31      | 30     | 31      | 31      | 30    |
| Total flight hours per month - day  | 435    | 523.9   | 549    | 548.7   | 480.5   | 384   |
| Total flight hours per day-5% night | 449.25 | 534.905 | 557.55 | 558.465 | 493.675 | 400.8 |
| Total flight hours per day - 25%    | 506.25 | 578.925 | 591.75 | 597.525 | 546.375 | 468   |

## **Table 7- Available flight hours - Totals**

| Species                        | April-August | April-September |
|--------------------------------|--------------|-----------------|
| Great skua (5% night)          | 2594         | 2995            |
| Red-throated diver (25% night) | 2821         | 3289            |

Bird Activity = Total bird flight time / hectare seconds

= 928 / 22,680,000

BA = 0.0000409171

Overall Area covered by VPs = 120.1Ha

Proportion of time potentially active = Area x BA = 0.004914145

Hours potentially active = 2995 (See Table 7)

Seconds potentially active (2995\*3600) = 10780722

Number of seconds of bird occur in airspace = sec potentially active \* bird activity

= 10780722\* 0.004914145

= 52978.02702

#### Calculate flight risk volume (Vw)

 $Vw = 1201000 (m^2) * rotor diameter (m)$ 

Vw = 186155000

#### <u>Calculate combined rotor swept volume</u>

Vr = number of turbines (n) \* pi \* r2 \* (max chord + bird length)

Vr = 4 \* pi \* 6006.25 \* (4.5 + 0.56)

Vr = 381718.81

#### Calculate bird occurrence in swept volume

Occurrence = no of sec of bird occ \* combined rotor swept volume/flight risk volume

= 52978.02702\* (Vr/Vw)

= 52978.02702\* (381718.81/186155000)

= 108.6337162

#### Calculate bird transits time and potential number of transits per year

Transit time = (max chord + bird length) / bird speed (m<sup>2</sup>)

= (4.5 + 0.56) / 14.9

= 0.339597315

No. of transits = occurrence / transit time

= 108.6337162 / 0.339597315

= 319.8897966

#### Stage 2 Collision Risk of Bird Passing through Rotor (Assuming No Avoidance)

|                                 | rs in blue | <del>-</del> |            |              |             |               |                |               |         | W Band       | 12/05/2022    |
|---------------------------------|------------|--------------|------------|--------------|-------------|---------------|----------------|---------------|---------|--------------|---------------|
|                                 |            |              |            |              |             |               |                |               |         |              |               |
|                                 |            |              |            |              |             |               |                |               |         |              |               |

#### Red Throated Diver - Year 1 (Linear)

A total of 9 red-throated diver registrations were recorded totalling 10 individuals from VP surveys, of which all flights were recorded through the risk window, crossing the window a total of 19 times. The flights included in the linear model and are shown in Figure 2.

#### Stage 1: Number of Birds Flying Through the Rotors per Year

Calculation of the 'risk window'; Cross section area equal to the width of the wind farm across the general direction of flight multiplied by the height of turbine to rotor tip. Width of wind farm was determined using GIS.

Width of transit flight (Ws) = 1590m

Turbine height (th) = 180m

Risk Window (W) = Ws \* th

= 1590m \* 180m

 $= 286,200 \text{ m}^2$ 

Calculate the area occupied by rotor blades (A)

Number of turbine (n) = 4

Rotor radius (r) = 77.5

A =  $n * \pi * r2$ 

A = 4 \* 3.14\* 6,006.25

A =  $75,438.5 \text{ m}^2$ 

Express the area occupied by rotor blades (A) as a proportion of the risk window (W)

Proportion (P) = A/W

= 75,438.5 / 286,200

= 0.2636

Calculate the number of bird potentially flying through the site per year (N)

N = number of red-throated diver transits at PCH per year

= hourly rate of transit \* available hours for flight

Hours surveyed between April 2021 and September 2021

= hectare hours (correcting for overlap) / hectares visible

in Study area

= 6300 / 120.3

= 52.369

No. of divers observed in same period = 19 transits in 11 flights

Hourly rate of transit = 19 / 52.369

= 0.3628

Hours available for flight are equal to number of daylight hours in the same period plus 25% of night hours (see Table 7)

Hours available = 3289 1

N = hours available \* rate of transit = 3289 1 \* 0.3628

= 1193.3

Calculate the number of birds flights (Nf) to fly through the rotor (P)

Nf = N \* P

= 1193.3\* 0.2636

= 314.54

#### Stage 2: Collision Risk of Bird Passing Through Rotor (Assuming No Avoidance)

Stage 2 was calculated using the prepopulated spreadsheet provided by Scottish Natural Heritage (SNH) for calculating the probability of collision for any species (available at: <a href="http://www.snh.gov.uk/docs/C234672.xls">http://www.snh.gov.uk/docs/C234672.xls</a>)

Variable highlighted in blue where entered into the spreadsheet. Bird biometrics where determined using the British Trust for Ornithology website (<a href="http://www.bto.org/about-birds/birdfacts">http://www.bto.org/about-birds/birdfacts</a>) bird flight speeds were assumed using the flight speeds characterised by Bruderer and Boldt (2001).

Calculation of collision rate

Collision Rate = Nf \* average probability of collision

= 314.54 \* 0.056

= 17.61

Calculation of collision rate applying 99.5% avoidance rate

= 17.61 \* 0.005

= 0.088

1. Correct collision rate for down time (assuming wind farm operates at 85%)

= (0.088 / 100) \* 85

Annual Collision Risk = 0.075

2. Calculate the number of year per collision

= 1 / 0.075

Year per collision = <u>13.4</u>

3. Calculate the number of collisions per lifetime of the scheme (given a 25 value for comparison)

= 0.075 \* 25

Collision / 25 years =  $\underline{1.87}$ 

#### Red Throated Diver - Year 2 (Linear)

A total of 3 red-throated diver registrations were recorded totalling 3 individuals from VP surveys, of which all flights were recorded through the risk window, crossing the window a total of 6 times. The flights included in the linear model and are shown in Figure 2.

#### Stage 1: Number of Birds Flying Through the Rotors per Year

Calculation of the 'risk window'; Cross section area equal to the width of the wind farm across the general direction of flight multiplied by the height of turbine to rotor tip. Width of wind farm was determined using GIS.

Width of transit flight (Ws) = 1590m

Turbine height (th) = 180m

Risk Window (W) = Ws \* th

= 1590m \* 180m

 $= 286,200 \text{ m}^2$ 

Calculate the area occupied by rotor blades (A)

Number of turbine (n) = 4

Rotor radius (r) = 77.5

A =  $n * \pi * r2$ 

A = 4 \* 3.14\* 6,006.25

A =  $75,438.5 \text{ m}^2$ 

Express the area occupied by rotor blades (A) as a proportion of the risk window (W)

Proportion (P) = A/W

= 75,438.5 / 286,200

= 0.2636

Calculate the number of bird potentially flying through the site per year (N)

N = number of red-throated diver transits at PCH per year

= hourly rate of transit \* available hours for flight

Hours surveyed between April 2022 and August 2022

= hectare hours (correcting for overlap) / hectares visible

in Study area

= 5250 / 120.3

= 43.64

No. of divers observed in same period = 6 transits in 3 flights

Hourly rate of transit = 6 / 43.64

= 0.137

Hours available for flight are equal to number of daylight hours in the same period plus 25% of night hours (Table 7)

Hours available = 2821

N = hours available \* rate of transit = 2821 \* 0.137

= 386.477

Calculate the number of birds flights (Nf) to fly through the rotor (P)

Nf = N \* P

= 386.477 \* 0.2636

= 101.88

#### Stage 2: Collision Risk of Bird Passing Through Rotor (Assuming No Avoidance)

Stage 2 was calculated using the prepopulated spreadsheet provided by Scottish Natural Heritage (SNH) for calculating the probability of collision for any species (available at: <a href="http://www.snh.gov.uk/docs/C234672.xls">http://www.snh.gov.uk/docs/C234672.xls</a>)

Variable highlighted in blue where entered into the spreadsheet. Bird biometrics where determined using the British Trust for Ornithology website (<a href="http://www.bto.org/about-birds/birdfacts">http://www.bto.org/about-birds/birdfacts</a>) bird flight speeds were assumed using the flight speeds characterised by Bruderer and Boldt (2001).

Calculation of collision rate

Collision Rate = Nf \* average probability of collision

= 101.88 \* 0.056

= 5.71

Calculation of collision rate applying 99.5% avoidance rate

= 5.71 \* 0.005

= 0.028

1. Correct collision rate for down time (assuming wind farm operates at 85%)

= (0.029 / 100) \* 85

Annual Collision Risk = 0.024

2. Calculate the number of year per collision

= 1 / 0.0.24

Year per collision = 41.67

3. Calculate the number of collisions per lifetime of the scheme (given a 25 value for comparison)

= 0.024 \* 25

Collision / 25 years = 0.6
